AUTHOR: Radtsig, Yu. Yu.

TITLE: Synthesis of inhomogeneous line for discrete matching

SOURCE: Ref. zh. Fizika, Abs. 9Zh298 25

REF SOURCE: Tr. Kazansk. aviats. in-ta, vyp. 85, 1964, 25-32

TOPIC TAGS: transmission line, microwave component

TRANSLATION: The author considers the problem of the synthesis of an inhomogeneous line for discrete matching in the microwave band of a complex impedance with the wave resistance of a feeder. It is shown that in the general case the problem of discrete matching reduces to the solution of the problem of moments. For the case of a continuous inhomogeneous line, the solution is written in the final form.

TITLE: Oxidation of Mg, Zn, and Cd films formed by vacuum condensation in a humid atmosphere
18 27 27 27 18

SOURCE: Zashchita metallov, v. 1, no. 6, 1965, 677-680

TOPIC TAGS: protective coating, metal film, corrosion resistance, magnesium, zinc, cadmium, metal oxidation

ABSTRACT: Oxidation of Mg, Zn, and Cd vacuum condensates has been studied at various values of relative humidity. The information is of interest because the quality of the metallic films obtained by vacuum spraying is determined mainly by their atmospheric corrosion stability. The investigation was performed by gravimetric and polarized light methods, varying the relative humidity from 0 to 99%, at a temperature of 20C. The results of the study are summarized in Figs. 1 and 2. It was established that the increase of weight and the thickness of the oxidized layer are 4 and 2 times greater for Mg and Cd, respectively, than for Zn. At a relative humidity <80% for Cd and Zn and <70% for Mg, the protective oxide films are formed in 1 to 2 days of oxidation. The corrosion rate for all 3 condensates increases rapidly at relative

TITLE: Synthesis of a continuous inhomogeneous line for broadband matching

SOURCE: Ref. zh. Fizika, Abs. 9Zh302

REF. SOURCE: Tr. Kazansk. aviats. in-ta, vyp. 85, 1964, 125-129

TOPIC TAGS: transmission line, real function, communication line, broadband communication, approximation calculation

TRANSLATION: The author considers the problem of approximating a real function of the reflection coefficient, defined in the entire complex plane, by means of entire functions of finite degree with integrable square on the real axis (functions of class W_σ). To solve the problem the author uses uniformly converging Kotel'nikov series, by means of which any entire function of finite degree $\sigma = T$ of class W_σ can be represented. The degree of the entire function T

Card 1/2

L 24255-66

ACC NR: AR6005260

is completely determined by the specified length of the inhomogeneous line. The author considers also the question of the error of the attained solution of the problem of synthesis of an inhomogeneous line. The greatest error is the one due to replacing the infinite series by a finite series. An expression is presented for the absolute error, which makes it possible to estimate approximately the degree of the mismatch. It is noted that the exact value of the mismatch can be taken into account by first-approximation theory and should be determined experimentally. The considered method of approximation has been verified experimentally: an inhomogeneous line of length 150 mm was used to match a helical antenna with maximum VSWR 2.6, with a 75-ohm coaxial cable in the 2000 -- 3000 Mc band. The results of the experiment are in good agreement with the theory. V. S.

Title : Fattening of Swine for Bacon.

Orig Pub: Probl. zootehn., 1957, No. 6, 46-54

Abstract: When swine are fattened for bacon, the duration of fattening is 4-6 months, and it is computed that at such time 6-8 months old piglets should attain a weight of 85-100 kg, which is prerequisite for 1st grade bacon. The fattening process is divided into 3 periods. During the 1st period, which lasts 8-12 weeks, daily weight gains should amount to 300-400 g and reach 550-600 g. at the end of this period.

 creasing the Piglet's Development before
 Weaning.
 ORIG. PUB. : Probl. zootehn. si veterin., 1958, No 4,
 24-36
 ABSTRACT : It was established that the piglet's weight at
 weaning is chiefly correlated to the weight of
 the boar at mating. Pigs of the categories II
 and III were mated with boars of the category
 I which gave better results than when mating
 was performed in the reverse manner.

Abstract: A discussion of the three factors to be considered in the improvement of pig stocks, namely prolificity, precocity and quality of the carcass, and of their determination by means of progeny testing. The procedures used in the two Rumanian stations currently doing progeny testing on pigs are described, and the results obtained so far with regard to Landrace and White York swine are presented. Includes 3 tables.

"The Morphological Study of the Synthesis of Type 7 Adenovirus in HeLa Cells."

Bucharest, Studii si Cercetari de Inframicrobiologie, Vol 17, No 4, 66, pp 303-305.

Abstract: In a study of the sequence of nuclear changes produced by type 7 adenoviruses in HeLa cells in order to determine the relations between viral protein and mature viruses, the authors were unable to find any evidence of protein crystals. They suggest that this may be due to uniform dispersal of the proteins or to the fact that under the experimental conditions used the viral infection did not lead to the formation of protein crystals.

Includes 21 figures and 8 references, of which one German and 7 English-language.

Title : Fattening of Swine for Bacon.

Orig Pub: Probl. zootehn., 1957, No. 6, 46-54

Abstract: When swine are fattened for bacon, the duration of fattening is 4-6 months, and it is computed that at such time 6-8 months old piglets should attain a weight of 85-100 kg, which is prerequisite for 1st grade bacon. The fattening process is divided into 3 periods. During the 1st period, which lasts 8-12 weeks, daily weight gains should amount to 300-400 g and reach 550-600 g. at the end of this period.
